

This PDF

In the idealised, fully-functioning equivalent of this app, the PDFs attached to topics are stored in some form of cloud BLOB storage via ActiveStorage.

However, this is one pdf being served to everything from ActiveStorage disk in production.

I know that this is ill advised, I understand why the absence of backups & scaling issues being a few of many associated problems but I did not get time to cache the PDF load so each time a topic is opened it queried my S3, meaning the 2000 GET request limit p/m very quickly got hit & I'd rather avoid putting something on the net that can bill me thousands.

Woah a second page, how cool

A third? Surely not
